

Smart Component Modeling for Complex System Development

AIRBUS

Philipp Helle, Sergio Feo-Arenis, Andreas Mitschke, Gerrit Schramm

Airbus Central R&T

CSD&M 2019 Paris, December 12th 2019

Customers demand

- New product features and capabilities
- With higher cadence

Development cycles are long and expensive

- Due to complexity
- Due to interdisciplinarity
- Due to customization
- Due to certification

Getting a product quick to the market

- Important for business success
- Customers tend to stop ordering old products in case a new one is announced

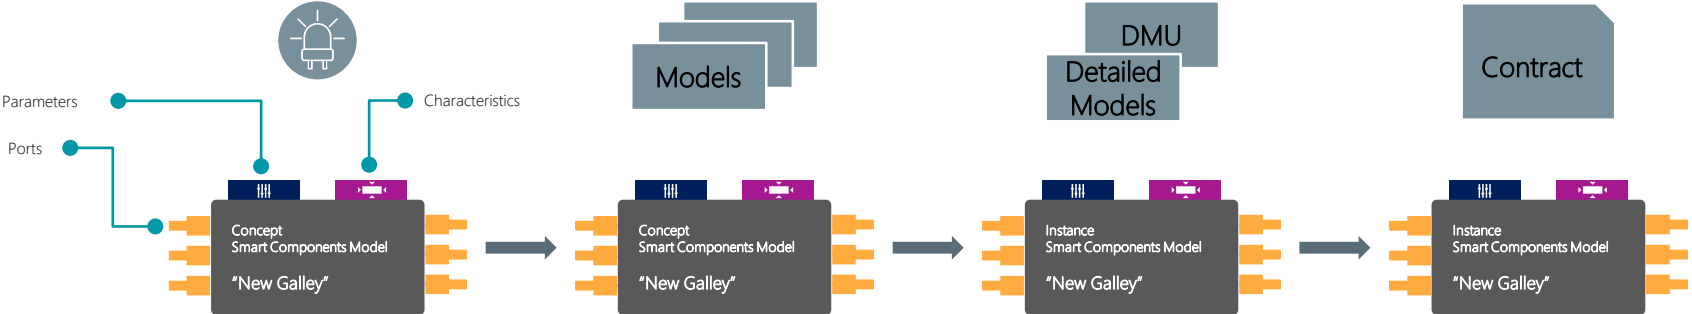

Increase development velocity and product quality without negative impacts on performance or certification

- Introduction of a new development process (Out of cycle)
- Digitalization of all process steps (MBSE)
- Automation where possible (supporting tool infrastructure)

Way of Working

- Central R&T to work independently from current tool vendor policy
- Ideal, greenfield approach
- Regular exchange with bigger Airbus initiatives; but not directly part of it

Out of Cycle Process

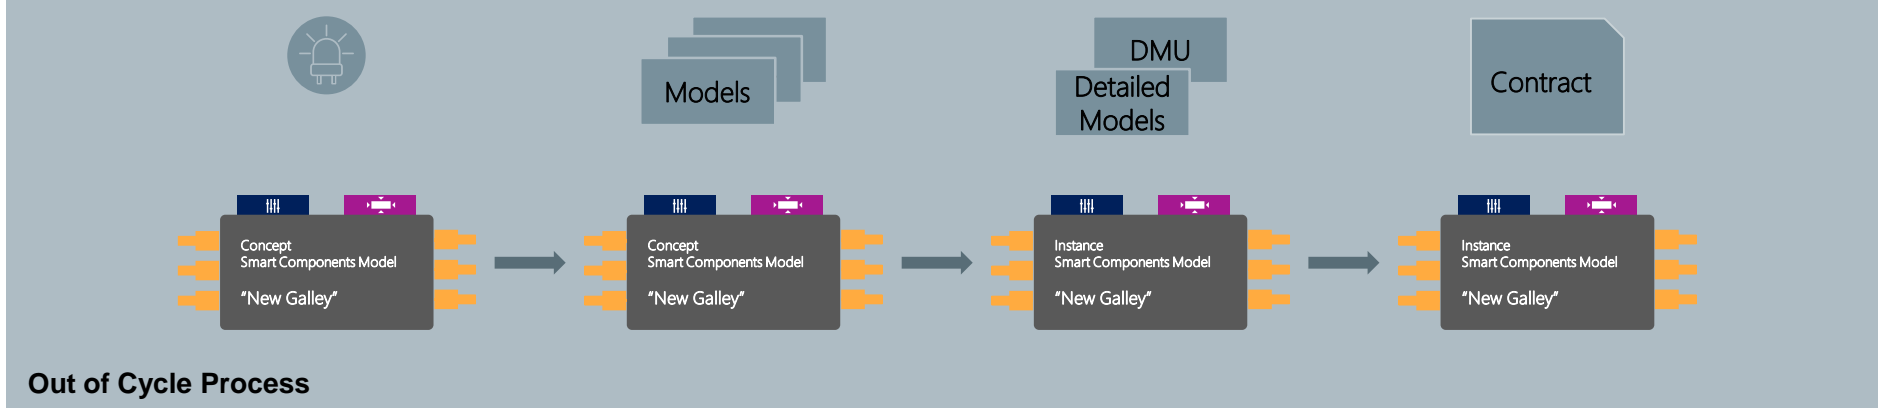

Out of Cycle Process

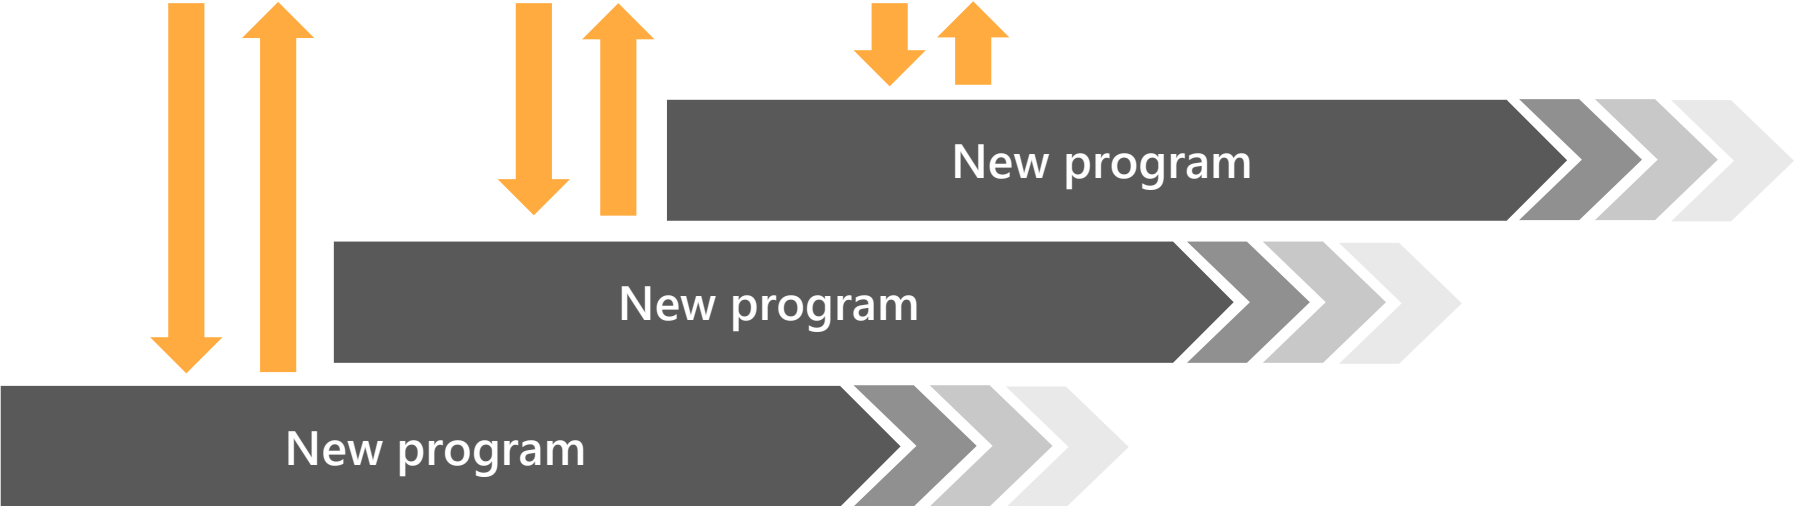

Out of Cycle Process

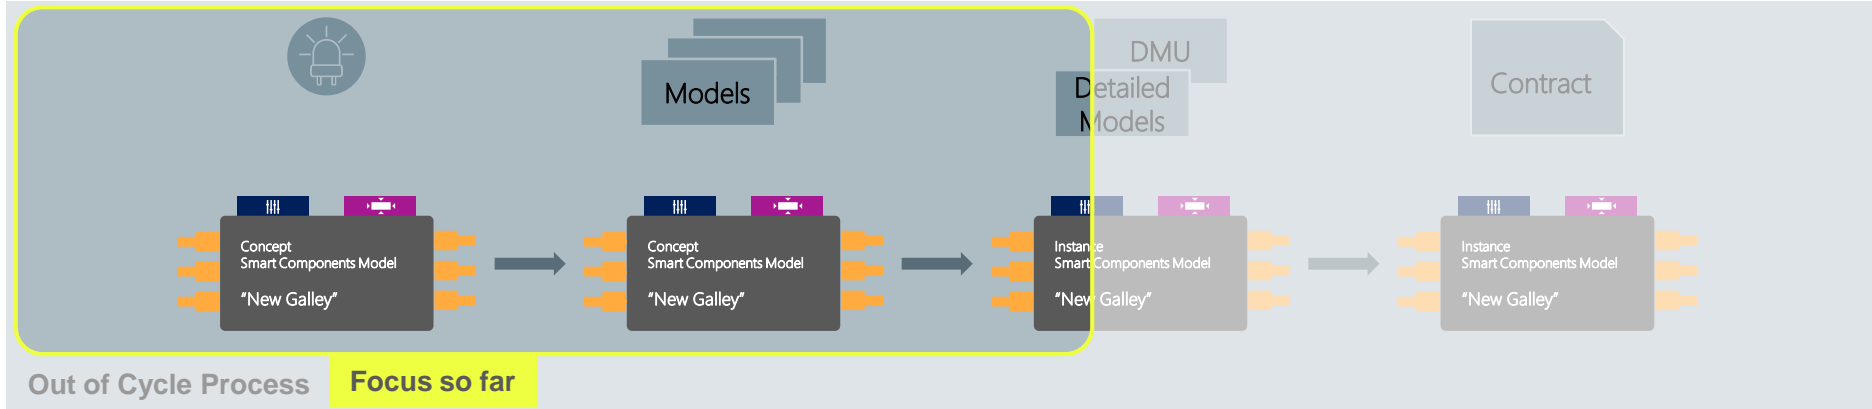

Out of Cycle Process

Out of Cycle Process

Out of Cycle Process

Out of Cycle Process

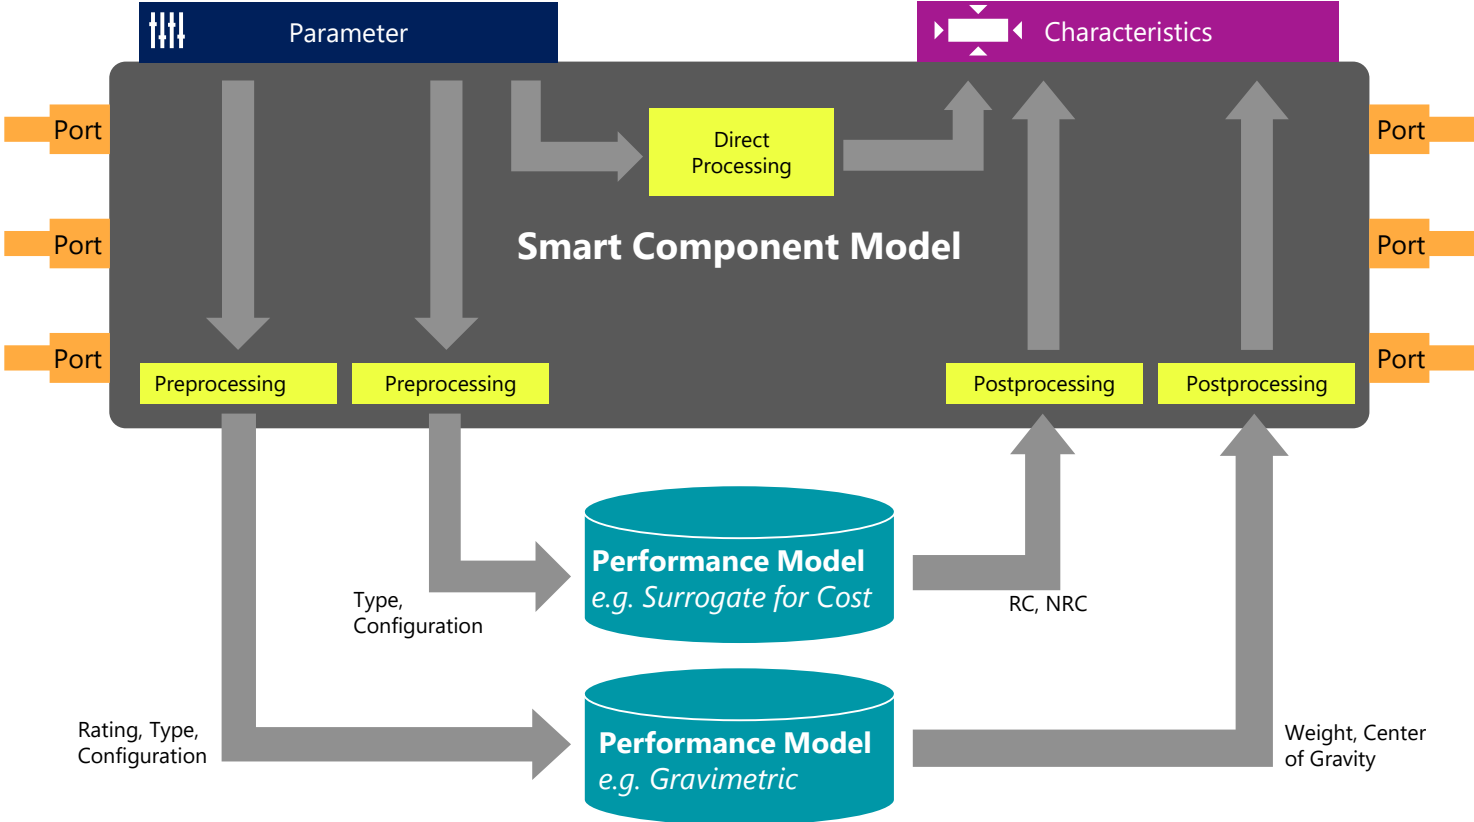

Focus so far

Main objectives:

- Pre-develop parametric design models (SCM) Out of Cycle
- Use for new aircraft programs (feasibility, concept) to save time
- Use models to perform multiple trade-studies

New program

What is a Smart Component Model?

Mechanisms of Smart Component Models

Parameter

Input variables that configure the model

Characteristics

Output variables that are calculated from input parameters

Parts/Occurrences

Allow decomposition of models

Transfer / Computation

Transfer information between model elements, potentially performing transformations

Model References

Specify external discipline models used to calculate performance or behavioral indicators

Aggregation Nodes

Perform internal computations

Constraints

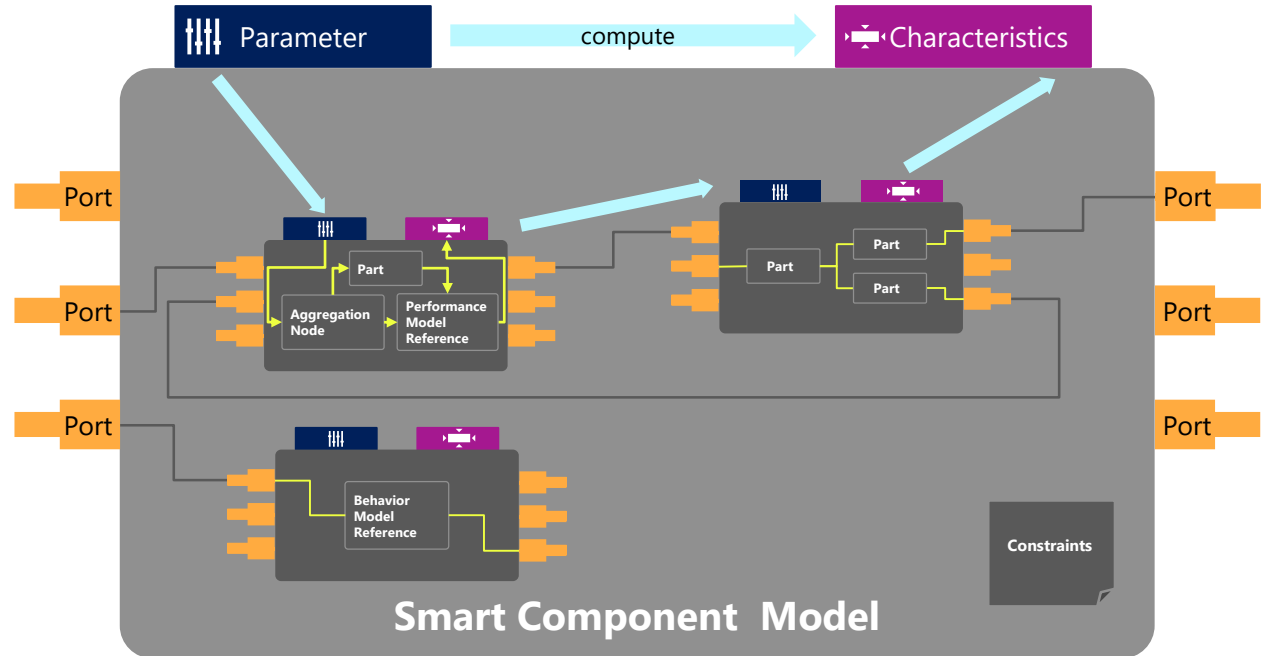

Specify value or structural requirements for all model elements

Ports

Represent interfaces of the modelled entity

Connectors

Connects pair of ports

- Explicit parameterization of models
- Occurrence modeling for deep nested modeling
- Formal type system with type and value checking
- References to external domain models
- Constraint definition and checking based on OCL¹/AQL²
- Flexible relation modeling
- Supporting tool infrastructure

¹Object Constraint Language

²Acceleo Query Language

Model editor – SCM Workbench

Formal
Ecore meta
model

Eclipse plugins
for model
editing

automatic

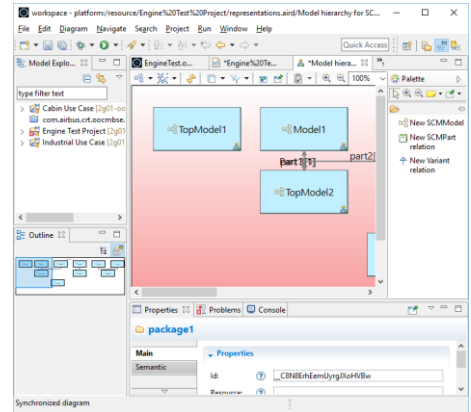

Graphical editor
for SCM models

```

Supporting Tool Infrastructure

AIRBUS

- New development with Out of Cycle development of components requires fitting metamodel
- EMF/Sirius allow agile metamodel and model editor development
- Evaluation of SCM approach in various use cases from different domains like manufacturing, design and operations successful
- Next steps: handover for industrialization of method & tools

Thank you!

AIRBUS
