

# THALES

Building a future we can all trust

## On the use of Artificial Intelligence for Product-Service Systems

Hugo Guillermo CHALÉ-GÓNGORA\*, Juliette MATTIOLI  
& Pierre-Olivier ROBIC

*\*Thales Corporate Engineering*  
Director Product Line & Systems Engineering  
INCOSE PLE IWG  
Outreach Lead

# PLAN

**1** What are Product Service Systems (PSS)?

**2** PSS Engineering issues

**3** PSS Engineering and AI

**4** Conclusion

# Global context – trends & challenges

## Volatile, uncertain, complex and ambiguous world...

- The Covid-19 pandemic, Ukraine... and their consequences are very tangible examples

## ...Full of challenges and opportunities

- New players – customers, providers, competitors
- Market growth spread world-wide
- **Emerging societal needs & constraints**
- Accelerated evolution of technology

INCOSE President  
Thales Australia

# Why Product-Service Systems (PSS)?

## Societal needs & trends

- Desire for simpler, environmentally-friendly, adaptable and easier-to-use products
- Growth of shared or collaborative economy
- New ways of working: work from home, distant-collaborative engineering

## Changing business contexts

- Commoditization of products, market saturation, large installed base
- Greater responsibility for products use and at end of life
- Customers shifting from CAPEX to OPEX

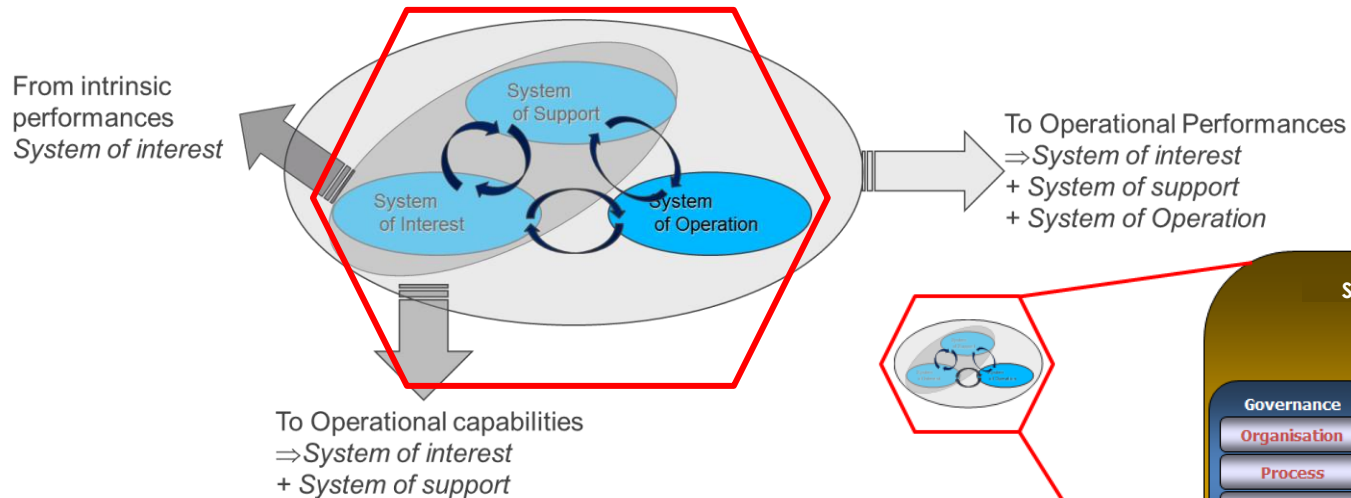

Industry	Margins in Product Business	Margins in Service Business
Machine tools	1 – 12%	5 – 15%
Paper machines	1 – 3%	10 – 15%
Power equipment	2 – 5%	15 – 20%
Rail vehicles	3 – 6 %	8 – 10%

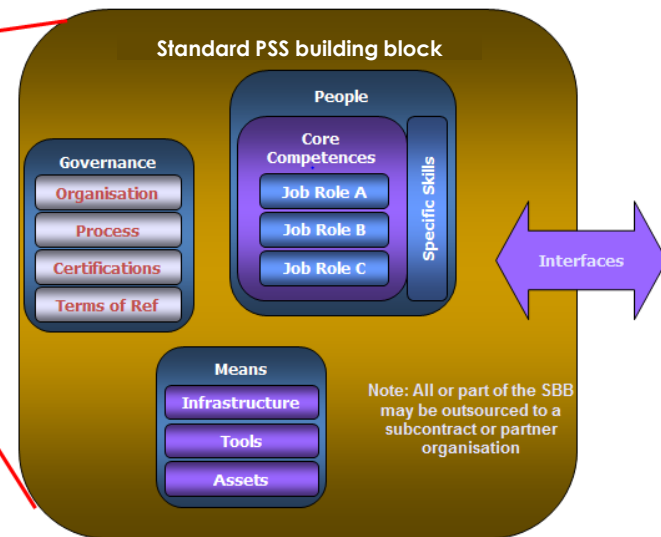

Monitor Group 2004

Moving towards service-oriented businesses and offers looks like a “logical” move

# What are PSS and PSS Product Lines?

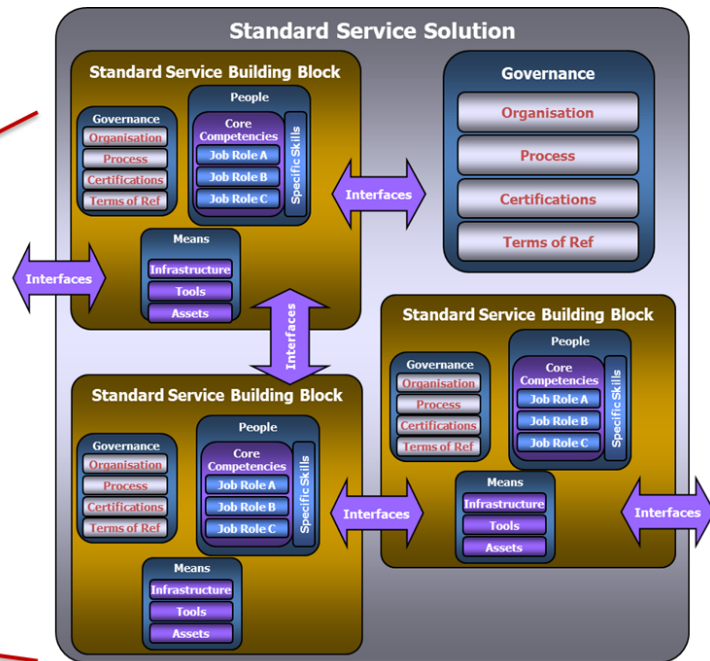

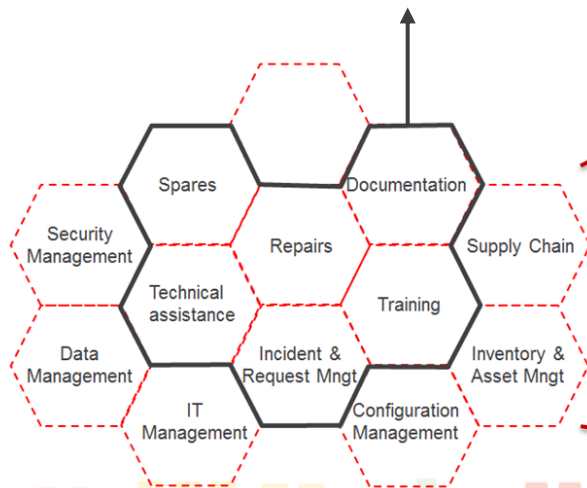

**Socio-technical systems** whose purpose is to deliver an *outcome* (operational performance), sharing governance, common infrastructures, assets & tools, common core competencies

# Engineering PSS and PSS Product Lines

## PSS building blocks configured, assembled and composed to obtain different emergent service capabilities

Example: **Operational Availability & Continuity**

# Specific PSS Engineering issues

## Deeper consideration of organizational and human aspects

- Procedures, languages, cultures, knowledge, capabilities and skills needed to develop PSS

## Emphasis on customers' business & operational performance, and profitability of the PSS provider

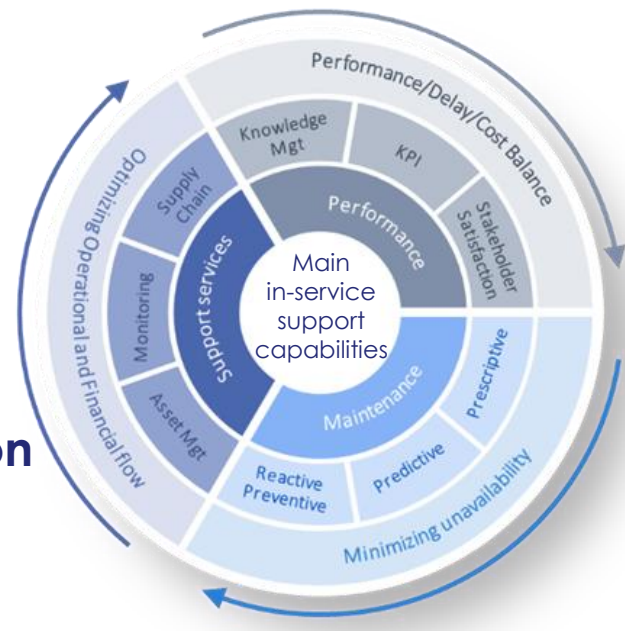

## Requirements: expected capabilities, services

## Measures of effectiveness

- SLA, pricing metrics vs customer satisfaction

## Slightly different focus of verification and validation

- Operational feasibility and usefulness
- Effectiveness of support to customer operational and business performance

# PSS Engineering and AI – what for?

## Reusing and sharing knowledge → Paramount for PSS PL

- Experience-based knowledge
- Knowledge captured in design documents, Product Data Management or Product Life-cycle Management (PDM/PLM) systems...

## Knowledge as the foundation of digital threads supporting the architecting, design and operation of PSS

### PSS Ontologies

*share domain concepts,  
reuse information from  
many sources*

*encode explicitly PSS knowledge  
improve collaboration*

*avoid uncertainty & ambiguities*

### NLP & FIS/ANFIS

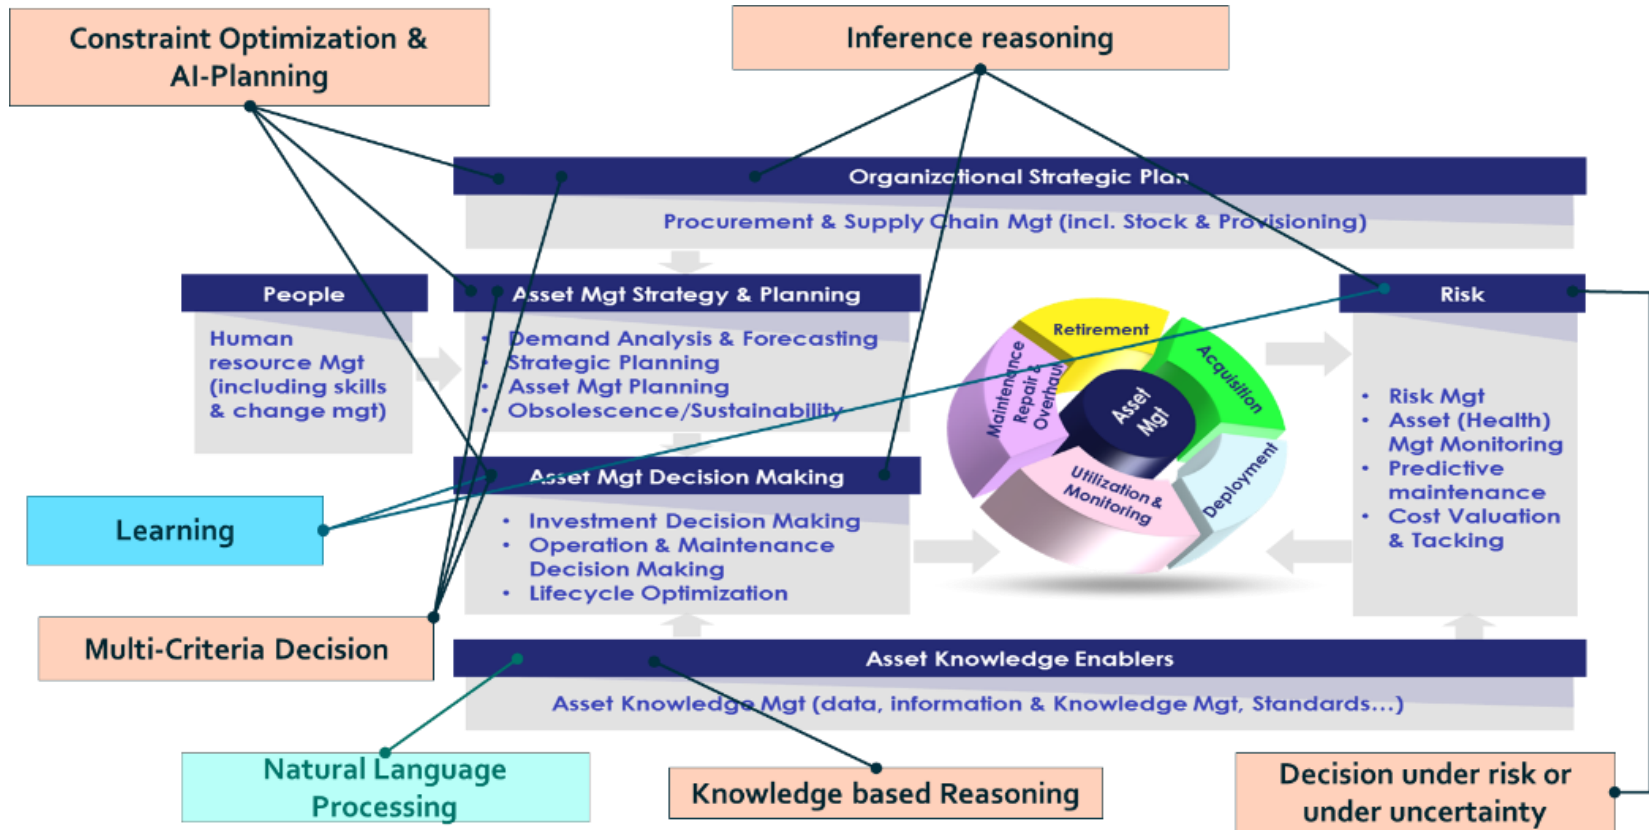

### Knowledge graphs

*increase (re)use of knowledge  
from design & operations  
reduce time and effort to  
configure a new PSS*

**Knowledge-based AI can improve knowledge management processes in an enterprise**

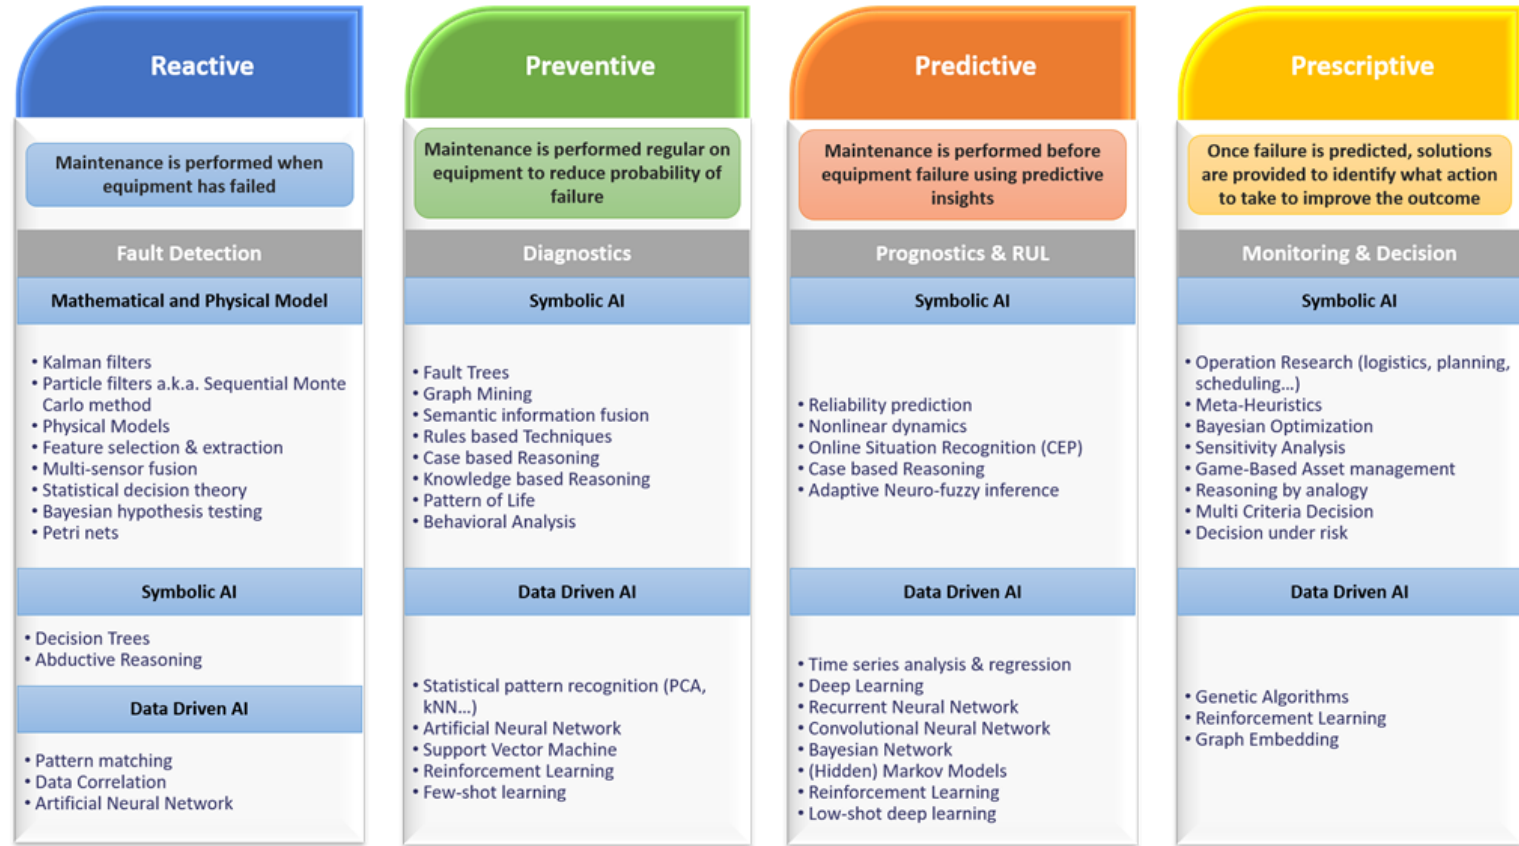

# AI for Asset Management

Myriad© to support performance-based contracts

# Conclusions

**Architecting and designing Product-Service Systems are often confronted to uncertainties because of the complex nature of the needs and requirements elicitation processes of performance-based contracts, for which traditional requirements development approaches are reaching their limits**

**Data-driven and knowledge-based AI can help streamline the entire PSS life cycle by making up-to-date information readily accessible and by supporting complex problem solving**

- Better PSS design and improved global quality
- Predictive market trending through forecasting analytics
- Identification of relevant manufacturing technologies
- Optimization of the overall production flow, through automation of operations
- Self-learning to detect anomalies and fix them through knowledge-based AI even before the PSS is deployed.

# Conclusions

- **Asset Management, Supply Chain Management, Total Quality Management, Total Production Maintenance... it is becoming difficult to optimize all MOE's and to anticipate, diagnose and control serious abnormal events in a timely manner**
- **AI brings to organizations the opportunity to move towards outcome-based commitments, pricing and contracts by using data-driven and symbolic AI algorithms**
- **AI can reinvigorate productivity and contribute to reducing service downtime of PSS**
- **By applying AI methodologies and tools, engineers can benefit from a certain automation to detect and fix failures or problems within the PSS, and reconfigure or adjust them efficiently throughout the PSS life cycle**
